The Issuer Defactor Labs

Defactor Labs is one of the leading companies bringing real world assets into the DeFi space. Dedicated to advancing the DeFi landscape, Defactor Labs has already facilitated \$17 million in transactions and settled \$2 million in funding. Their business model includes providing secured liquidity and developing innovative financial structures, such as the Alpha Series.

The Alpha Solution

Defactor Labs provides investors with secure, compliant access to DeFi investments through the Alpha Bond offering, the first securitization vehicle of its kind in Europe. It bridges the gap between traditional finance and DeFi with unrivalled operational efficiency, transparent on-chain collateralization and institutional-grade security.

The Alpha project connects investors to promising SMEs through a blockchain-based platform, allowing them to provide secured operational liquidity whilst earning a sustainable yield.

The compliant Luxembourgish funding structure was created by Black Manta Capital Partners, a BaFin licensed broker-dealer with an extensive track record in tokenizing assets, and offers investors a secure and reliable entry point to the world of DeFi.

How it works

Defactor Labs tokenizes real world assets by dividing them into divisible smaller units, with each unit representing fractional ownership of the underlying asset. Investing in the Alpha Bond adds funds to Defactor Labs' liquidity pools, which are used to allocate funding to asset owners so that they can access capital more efficiently.

The tokenization process and collateralization of the loan are recorded on the immutable blockchain, providing enhanced security and transparency for all parties involved.
